

## Dry Edible Beans

### Weather Slows Harvest, Sows Uncertainty

This season, cool wet weather delayed both planting and harvesting of the 2009 dry-bean crop. In mid-October, North Dakota's harvest progress was well behind the 5-year average due to a series of storms. Bean quality and value could be adversely affected by the moisture. According to the October USDA estimate, production of all bean classes is expected to be 25.2 million cwt, down 2 percent from a year earlier but 3 percent more than the initial forecast in August. Most of the gain since the August forecast was due to an increase in estimated area. The estimate for planted area was increased to 1.53 million acres—3 percent more than a year ago and the same gain originally indicated at the end of January in *Prospective Plantings*. Because of greater crop losses (primarily to flooding and hail) this season, only 94 percent of planted area is expected to be harvested—down from 97 percent a year earlier. Although lower than 2008, the share harvested is up from an average of about 93 percent over the past 5 years. Acreage losses were most severe in North Dakota where cool, wet weather caused about 10 percent of planted area to

Table 17—U.S. dry beans: Production, 2006-2009

Item	2006	2007	2008	2009 f	Percent change

be abandoned. U.S. harvested area is currently expected to be down 1 percent from last year to 1.44 million acres. Harvested area is expected to be above year-earlier levels in most of the 18 reporting States, but among the 5 States with lower acreage are 3 of the top 4 producing States—North Dakota, Minnesota, and Nebraska.

National dry-bean yield was forecast to be 17.54 cwt per acre—a 1-percent reduction from last year’s record high. The 2009 yield is significant in that it is only the sixth time that annual average U.S. dry-bean yields have exceeded 17 bags (cwt) per acre. Area planted by class and State yields currently suggest that production of most classes of dry beans will decline or remain near year earlier levels, with the likely exception of blackeye, baby lima, garbanzo beans, and possibly pinto beans (assuming production States such as Nebraska, Colorado, and Idaho outweighs lower yields in North Dakota and Minnesota). Estimated production by class will be released by USDA in the December 11 *Crop Production* report.

### **Prices Wobble But They Don’t Fall Down**

Reflecting normal seasonal movements as new crop beans become available, prices for several classes of dry beans began to slip from their September levels. However, harvest delays in the upper Midwest and uncertainty with regard to final volume and quality has largely prevented any further downward movement so far this month. Although 2009 grower prices for most classes are expected to average below the inflated highs of a year earlier, they will also remain well above their long-run averages, reflecting generally low carry-in stocks and this year’s modest crop. Significant harvest damage to the crop remaining in the field in North Dakota or Michigan would further aggravate an already tight supply situation and strengthen prices for classes such as pinto, navy, and black beans.

September’s preliminary “all dry-bean” price of \$30.90/cwt began the crop year 16 percent below a year earlier. However, comparisons to last year’s unusual highs are not a fair measure of this year’s potential market. In fact, 2009/10 got off to another strong start, running 28 percent above the average of the previous 5 years. If this price holds, it would also be the second strongest season-opening dry-bean price in history (behind only 2008). In a typical year, about a third of all dry beans are marketed by the end of October. But with wet weather slowing the pace of harvest, the share marketed “off the combine” may be less than usual this season, helping to support the current market and providing support for a more orderly flow this year.

Table 18—U.S. dry beans: Monthly grower prices for selected classes, 2008-09

Source: USDA, NASS, *Agricultural Prices* and USDA, AMS, *Bean Market News*.

Through mid-October, grower prices generally averaged 9 percent to 28 percent below those of a year earlier. Large lima beans were an exception with prices unchanged. Pinto beans from Minnesota/North Dakota were running 9 percent below a year earlier in mid-October (but were creeping up with harvest uncertainty), while blackeyes from California were down 13 percent. Pinto beans typically account for 40 to 45 percent of all dry bean production. On the other end of the spectrum, Idaho/Washington small red (down 28 percent) and garbanzo (down 29 percent) beans each showed larger reductions, likely reflecting stronger supply situations. With supplies this year that may about match expected demand, ending stocks for the 2009/10 season are again likely to be tight for most classes. As a result, after the crop is finally in the bin and prices reach equilibrium this fall, the market may slowly move higher into the spring with gains depending on the strength of export demand (especially from Mexico where drought has trimmed supplies) and recovery in employment levels (critical to foodservice demand).

### ***Exports Surge, Imports Slip in 2008/09***

During the 2008/09 marketing year (September-August), U.S. dry-bean export volume surged 17 percent from a year earlier to 9.55 million cwt (table 19). Although volume shipped to the Dominican Republic (down 14 percent), Japan (down 11 percent), and Spain (down 21 percent) declined, it was more than offset by increased shipments to top three markets Mexico (up 90 percent), Canada (up 8 percent), and the United Kingdom (up 8 percent). Exports declined for 8 of 15 dry bean trade categories, reflecting lower supplies and higher prices. However, increased movement of black beans and pinto beans were key to greater volume in 2008/09. While pinto bean export volume was the highest since 1994/95, the volume of black bean exports easily eclipsed (by 20 percent) the previous record high set in 1981/82.

About 87 percent of black bean exports and 36 percent of pinto bean exports were shipped to Mexico. Increased demand from Mexico was the most significant development during the 2009/10 export season. About 38 percent of all U.S. dry-

bean exports were shipped to Mexico, up from 24 percent a year earlier and 29 percent over the previous 3 years. Black beans and pinto beans accounted for 86 percent of all U.S. dry beans shipped to Mexico in 2008/09. U.S. dry bean export value to Mexico rose 79 percent from a year earlier to \$121 million, with black beans accounting for about \$58 million. The average export value per pound for all U.S. dry beans shipped to Mexico was 33.0 cents, down 5 percent from a year earlier.

Navy-bean exports rose 12 percent to 1.72 million cwt—the fourth consecutive annual increase and the strongest volume since 2000/01. Navy-bean movement was greater for each of the top 3 markets. The United Kingdom, which accounted for 51 percent of U.S. navy-bean export volume, received 18 percent greater volume from the United States in 2008/09. About 40 percent of U.S. navy-bean exports was shipped to Canada, which took 50 percent more volume than a year earlier.

Dry-bean import volume fell 9 percent to 2.95 million cwt during the 2008/09 crop year—second only to the 2007/08 record high. Imports were up for the top two classes, with garbanzo beans (the top dry bean import in 2008/09) up 27 percent (due to low domestic supplies) and mung beans up 5 percent—continuing their longrun upward trend. With improved domestic supplies last year, imports of black beans (down 38 percent), pinto beans (down 30 percent), and navy beans (down 35 percent) were each lower.

With the 2008/09 average import price up 9 percent to 48 cents/pound, the value of all U.S. dry-bean imports remained about the same as a year earlier at \$141 million. Canada (down 17 percent), Mexico (down 7 percent), China (down 43 percent), and Peru (up 264 percent) were the top four foreign suppliers of dry beans over the past marketing year, accounting for three-fourths of U.S. import volume. China accounted for 14 percent of all imports, with 50 percent of the volume split between mung beans and black beans. As with China, dry-bean imports from Peru have been trending higher this decade, accounting for 12 percent of total volume in 2008/09. Peru ships a broad spectrum of dry beans to the United States, although nearly half of the volume in 2008/09 consisted of blackeye beans.

r= revised. p = preliminary. f = ERS forecast. Totals may not sum due to rounding. 1/ Per capita disappearance reflects domestic production, net trade, and estimated change in stocks.

2/ Includes small white and all other dry edible beans after 1979.
