Vegetables and Melons Situation and Outlook Yearbook

Gary Lucier and Alberto Jerardo

Abstract

With total production of vegetables and melons rising 2 percent in 2004, per capita disappearance (use) of all vegetables, melons, and pulses increased about 1 pound to 449 pounds. Despite a 4 percent increase in retail prices, fresh-market vegetable consumption (including melons, potatoes, sweet potatoes, and mushrooms) totaled about 228 pounds—up 1 percent from a year earlier. Fresh-market per capita use rose for commodities such as spinach, cauliflower, onions, cabbage, and romaine and leaf lettuce while declining for garlic, asparagus, celery, and tomatoes. Per capita use of processing vegetables increased 1 percent to 122.5 pounds in 2004. The vegetable and melon trade deficit widened in 2004 as the value of imports increased at a greater rate than the value of vegetable and melon exports. The United States imported about 15 percent of all the vegetables and melons consumed domestically in 2004, with 16 percent of fresh market crops being sourced from other nations compared with 10 percent in 1994.

Keywords: Potatoes, tomatoes, onions, lettuce, dry beans, mushrooms, production, consumption, prices, trade.

Summary

Per Capita Use to Remain About Steady

The current forecast for 2005 indicates that per capita vegetable disappearance (also referred to as use or consumption) will remain near a year earlier (decline less than 1 pound). However, there is a strong downside risk to this forecast, due largely to an expected reduction in the potato crop this fall. At the present time, increased use is projected for melons, dry beans, and freezing vegetables, with declining use expected for fresh market vegetables, canning vegetables, potatoes, and sweet potatoes. Per capita fresh vegetable disappearance is expected to decline about 1 percent as rising use of spinach, garlic, and leaf and romaine lettuce is outweighed by potential reductions for onions, iceberg lettuce, and carrots. Assuming favorable weather and demand into the fall, consumption of fresh sweet corn and leaf/romaine lettuce could again approach record highs in 2005. With strong romaine shipments over the remainder of the year, per capita use of leaf and romaine lettuce could exceed the record high 12 pounds reached in 2004.

Although production was likely down in Florida and Georgia this year, domestic fresh-market sweet corn disappearance could still remain near last year's record high with good spring volume from California and expectations for improved output in New York, where yields were low in 2004. Last season's low onion prices have caused storage onion producers to pull back on acreage this year. Given lower production in 2005, f.o.b. shipping-point prices will improve and per capita use of fresh-market onions will likely drop below the 2004 record high. A rebound in use is expected for dry edible beans in 2005 as increasing production, higher imports, and smaller exports offset the effects of low beginning stocks.

In 2004, per capita disappearance (use) of all vegetables, melons, and pulses increased about 1 pound to 449 pounds. For fresh-market vegetables (excluding melons, potatoes, sweet potatoes, and mushrooms) disappearance rose 4 percent to nearly 151 pounds in 2004. Including melons, potatoes, sweet potatoes, and mushrooms, fresh-market vegetable consumption totaled about 228 pounds—up 1 percent from a year earlier. Fresh-market per capita use rose for commodities such as spinach (up 17 percent), cauliflower (14 percent), onions (11 percent), cabbage (10 percent), and romaine and leaf lettuce (7 percent). Fresh use declined for items such as garlic (down 9 percent), asparagus (4 percent), celery (4 percent), and tomatoes (1 percent).

Per capita disappearance of processing vegetables (excluding potatoes, sweet potatoes, and mushrooms) increased 1 percent to 122.5 pounds in 2004. On a fresh-equivalent basis and excluding potatoes, pulses, and mushrooms, total disappearance of vegetables used in manufacturing frozen, canned, and dehydrated products in 2004 was estimated to be 36.0 billion pounds—up 2 percent from a year earlier. Assuming continued improvement in the general economy this summer and fall, the outlook for 2005 points to relative stability in per capita use of processing vegetables, as gainers and decliners largely offset one another.

Disappearance of vegetables for freezing (excluding potatoes) increased 3 percent to a record 6.3 billion pounds (22.9 billion including potatoes) in 2004. On a per capita basis, use of freezing vegetables (excluding potatoes) increased 2 percent to 21.6 pounds last year (the record was 23.1 pounds in 1996). Including potatoes, freezing vegetable use was largely unchanged at 78 pounds per person. Increases were noted for commodities such as spinach (up 16 percent), snap beans (up 5

percent), and broccoli (up 3 percent), with declines coming in lima beans (down 21 percent) and green peas (down 12 percent).

The per capita disappearance estimate for canning vegetables (excluding potatoes) increased 2 percent to 99.8 pounds in 2004. Total domestic disappearance of canning vegetables in 2004 rose nearly 3 percent to a record 29.3 billion pounds. Increases were noted for commodities such as pickling cucumbers, tomatoes, and carrots, with declines for green peas, asparagus, and sweet corn. With the second-largest crop on record, greater imports, and an improving economy, disappearance of processing tomatoes increased in 2004, rising 2 percent to 20.7 billion pounds. Tomatoes accounted for 71 percent of 2004 canning vegetable disappearance. The outlook for 2005 indicates a small gain in per capita use of processing tomatoes as burdensome stocks are drawn down and low prices and strong employment encourage increased consumption.

According to preliminary data for 2004 (utilization estimates for the previous crop year are not published until September 22), per capita use of fresh and processing potatoes fell 2 percent in calendar 2004 to 135.5 pounds, with both fresh and processing uses declining. The reduction in 2004 largely reflects a shifting of products into the export market (export volume rose 12 percent) with little change in total supply noted from the previous year. In 2005, total potato consumption is currently forecast at 134 pounds, with production this fall expected to be lower and prices projected to rise.

Further highlights in the annual per capita use estimates for 2004 include:

- Melon use declined 8 percent to 24.6 pounds per person—the third consecutive annual decline. Use of each of the three top melons was down. Cantaloup use declined 12 percent to 9.5 pounds, the lowest disappearance since 1995 with both production (down 8 percent) and imports (down 15 percent) lower.
- Driven by record-large production, fresh-market sweet corn consumption reached a record 9.6 pounds per person. Despite the presence of various low-carb diets, consumers continue to be drawn to the improved quality and value of supersweet varieties.
- Fresh broccoli disappearance rose 7 percent to 5.9 pounds per person, the third highest on record as both production and imports (record high) increased.
- Estimated fresh-market cauliflower consumption jumped 14 percent to 1.8 pounds as production and imports both increased. Production increased 8 percent from a year earlier but remained 8 percent below the record-high volume of 1994.
- Disappearance of all tomatoes increased nearly 1 percent to 89.7 pounds per person (fresh-equivalent basis) as a 1-percent reduction in fresh-market use (to 19.3 pounds) outweighed a 1 percent gain in processing use (to 70.4 pounds, fresh-equivalent basis). For the first time, fresh-market use includes an Economic Research Service (ERS) estimate for domestically-produced greenhouse tomatoes (375 million pounds), which added 1.3 pounds to the per capita total. Hothouse tomatoes from import sources have long been included in the per capita use estimates.
- Combined fresh and processing dry-bulb onion disappearance rose 7 percent from a year earlier to 22.8 pounds per person in 2004. For the third consecutive year,

fresh-market onion use was record high as both production (up 18 percent) and imports (up 7 percent) set new standards. Fresh dry-bulb onion use rose 11 percent to 21.7 pounds per person. Among all fresh-market vegetables and melons, onions trail only potatoes and iceberg lettuce in terms of volume used.

- Supported by larger acreage and better yields, per capita pumpkin disappearance rose 21 percent to 4.7 pounds—the strongest use this decade. Pumpkin acreage has quadrupled since the early 1980s largely as a result of the increased popularity of seasonal decorative uses.
- With improved yields boosting production in 2004, fresh-market cabbage use recovered from the small crop of 2003 and rose 10 percent to 8.3 pounds per person. Per capita use of fresh cabbage has changed little since stabilizing in the early 1970s, with use each decade averaging around 8.5 pounds. Domestic disappearance of fresh-market cabbage totaled nearly 2.5 billion pounds in 2004.
- In 2004, per capita use of snap beans declined for the third consecutive year since the most recent peak of 2.2 pounds in 2001 (the all-time peak occurred in 1943 at 5.3 pounds). Despite an increase in production and imports in 2004, disappearance dropped 3 percent to 1.9 pounds per person--11 percent below the 2001 level. With prices lower, export demand jumped 61 percent to a record 82 million pounds, with 94 percent moving into Canada.

Vegetable Output Rises in 2004

Total U.S. vegetable and melon output rose 2 percent in 2004 despite losses during the late summer and fall stemming from hurricanes in the East, early frost in the upper Midwest, and heavy fall rain in California. Vegetable output in 2004 was 5-percent below the 1999 peak but 6-percent above the average for the 1990s. Reduced output for dry edible beans (down 21 percent), processing green peas (down 17 percent), and processing sweet corn (down 9 percent), was outweighed by gains for processing tomatoes (up 25 percent), processing snap beans (up 13 percent), and onions (up 10 percent). Fresh-market vegetable and melon production increased 3 percent from a year earlier. This was also 5 percent above the output of 2002. Production rose on the strength of improved yields plus a 1-percent gain in harvested area to 1.95 million acres. Although fresh-market output increased in only 18 of the 39 surveyed States, the top two producing States, California (up 3 percent) and Florida (up 8 percent) each produced more fresh vegetables despite weather setbacks this past fall. Processing vegetable production increased 13 percent due mostly to the large processing tomato crop. Reduced harvested acreage (down 9 percent) and lower yields (down 13 percent) pulled the U.S. dry bean crop down in 2004. A rebound in production is expected in 2005 as acreage rises and yields improve. Potato production remained about steady in 2004, changing little from either 2002 or 2003. Meanwhile, small increases in acreage and yields (to a record-high 174 cwt/acre) resulted in a 1-percent gain in the sweet potato crop to 16.1 million cwt—the largest crop since 1962.

Fresh-Market Prices Up

During the first 6 months of 2005, f.o.b. shipping-point prices (a proxy for grower prices) averaged 11 percent above a year earlier as higher prices during the spring quarter (April-June) outweighed lower prices during the winter quarter (Jan.-Mar.). During the winter quarter, shipping-point prices declined 5 percent from a year

earlier as periods of cool, rainy weather were brief enough to have little effect on yields and shipment volume coming out of the California/Arizona desert and Florida. However, the rain storms did affect the timing of spring-crop planting and the accompanying cool, windy conditions persisted into the spring, resulting in delayed harvests and reduced yields. Crops in Mexico were also affected, with the weather causing shipments of fresh-vegetables to the United States to decline from a year earlier. As a result, supplies of all fresh vegetables in the United States during the second quarter were reduced, resulting in shipping-point prices averaging 28 percent above the low levels of a year earlier.

In 2004, shipping-point prices for fresh-market vegetables and melons declined 1 percent from a year earlier. Quarterly prices averaged below a year earlier for every quarter except the winter quarter, which registered a gain of 18 percent. This was followed by a 13-percent decline during the spring quarter and a 2-percent decline during the summer quarter. In the fall, fresh-market shipping-point prices fell less than 1 percent from the very high levels experienced during the fall of 2003. This was due to the effects of the East Coast hurricanes and California rain storms on supplies of warm season crops such as tomatoes, peppers, cucumbers, snap beans, and sweet corn.

Retail prices for fresh-market vegetables (including potatoes) averaged 4 percent above a year earlier in 2004. Despite high prices for tomatoes and other warm-season vegetables during the fourth quarter, fresh-market grower prices declined 1 percent for the year and the farm-value share of the fresh vegetable retail price fell slightly to 19 percent in 2004. Fresh-market retail prices rose 3 percent during January-June but increased nearly 6 percent during the last half of the year. While consumers paid less for head lettuce (down 3 percent), retail prices averaged higher for tomatoes (up 10 percent), potatoes (up 1 percent), and other miscellaneous vegetables (up 5 percent). In 2005, retail prices for fresh-market vegetables are projected to average 1 to 4 percent above a year ago due largely to increased costs for energy, labor, and packaging.

Tomato Prices Soar on Fall Weather Damage

A series of severe weather events came together during the fall of 2004 to disrupt the supply of fresh-market field grown tomatoes, resulting in record-high retail prices. An unusually severe storm hit central California in mid-October, damaging a portion of the fall fresh tomato crop and halting harvest. Although lower shipments were expected, supplies from the central California crop were expected to recover before the season ended in late November. Growers in the smaller-volume San Diego deal were spared the first storm and continued shipping tomatoes. However, in late October, a second heavy rain storm hit central and southern California, delivering a severe blow to much of the entire State's field-grown tomato crop with daily shipments of most types of field-grown product reduced by more than one-half.

These acute weather events in California came on the heels of an unprecedented series of mid-to-late summer hurricanes and tropical storms that brought winds and heavy rains to East Coast vegetable-producing areas from Florida to New England, battering crops and early-fall plantings. In Florida, the storms delayed or damaged fall plantings of crops such as tomatoes and bell peppers, requiring replanting of crops in many areas. Thus, shipments of these crops were set for a delay that lasted until mid-December, with market volume not reaching seasonal norms until mid-to-

late December. As volume picked up, early December fresh tomato shipping-point prices began to drop, with stronger tomato shipments from both Florida and Mexico. The national average retail price for fresh field-grown tomatoes reached a record-high \$2.47/lb in December but declined substantially in January to \$1.66/lb—within the normal-high range for that month.

Prices for fresh-market tomatoes are highly volatile and react readily to supply shortfalls as well as oversupply situations. Shipping-point prices for mature green tomatoes rose steadily from early September to late October, moving from \$6 to over \$30 (depending on size and quality) per 25-pound box. The total cost of production for fresh tomatoes produced in California's San Joaquin Valley is between \$5 and \$6 per 25-pound carton, given average yields (around 1,100 boxes per acre and assuming a 72-percent pack-out rate). The cost of production is around \$9 per box for tomatoes produced in Southwest Florida.

Vegetable Trade Deficit Widens

In calendar year 2004, continued U.S. demand for lower-cost imports allowed the trade deficit in vegetable crops (includes melons, pulses, potatoes, and planting seed) to continue expanding. While the value of U.S. exports increased 5 percent to \$3.5 billion, imports rose 14 percent to \$6.2 billion. The value of exports last exceeded imports in 1995. In 2004, U.S. vegetable, melon, and pulse imports from Mexico rose 15 percent while Mexico's share of U.S. import value rose for the second consecutive year to 45 percent (from 44 percent a year earlier and 43 percent 2 years earlier).

Imports from Canada rose 11 percent to \$1.5 billion in 2004, driven largely by tomato ketchup (up 50 percent), canned sweet corn (up 25 percent), fresh greenhouse tomatoes (up 19 percent), and frozen french fried potatoes (up 18 percent). Canada's share of the U.S. vegetable, melon, pulse, and seed import markets remained about steady at 25 percent in 2004. Canada shipped \$515 million in frozen french fries to the United States in 2004--one-third of all Canadian vegetable and melon exports to the United States.

China continued to experience double-digit growth in exports of vegetables to the United States in 2004. With increased shipments of fresh garlic (up 63 percent to \$39 million) and fresh and processed mushrooms (up 27 percent to \$59 million), imports from China (including a small amount from Hong Kong) increased 28 percent to \$281 million—increasing their share from 4 percent to nearly 5 percent of the U.S. import market. Vegetable imports from China are up 53 percent since 2002, with 57 percent of the 2004 total coming from (dried vegetable products, mushrooms, and fresh garlic). Among the \$61 million in dried imports from China were \$17 million in miscellaneous peppers (up 30 percent). About \$50 million in canned vegetables (excluding mushrooms) were shipped from China to the United States in 2004, with Chinese water chestnuts accounting for \$10 million (up 122 percent).

The volume of fresh vegetable (excluding potatoes and melons) imports increased 4 percent in calendar 2004 and the value of those imports rose 13 percent from a year earlier. Imports from Mexico (up 13 percent), Canada (14 percent), and Peru (23 percent) each increased. Together, Mexico and Canada accounted for 85 percent of U.S. fresh-market vegetable import value in 2004. Import volume increased for items such as onions (up 7 percent), bell peppers (5 percent), and cucumbers (4

percent), and declined for tomatoes (down 1 percent) and celery (17 percent). Melon import volume declined 5 percent due largely to continued softness in the cantaloup market. The fresh-market import share of consumption declined slightly from 2003's record-high of just over 16 percent, to just under 16 percent.

While the volume of fresh vegetable exports increased 1 percent in calendar 2004, the value increased 6 percent to nearly \$1.3 billion. The value of fresh exports to Canada (6 percent) and Mexico (23 percent) each increased. Canada accounted for 77 percent of U.S. fresh-market vegetable exports in 2004—up slightly from 2003. The value of fresh exports to Japan (down 2 percent) declined for the fourth consecutive year. Export volume increased for items such as tomatoes (up 17 percent), leaf and romaine lettuce (12 percent), and head lettuce (5 percent), and declined for onions (down 9 percent), cabbage (13 percent), and carrots (15 percent). Melon export volume increased 6 percent in 2004 with most of the volume moving into Canada. In 2004, the United States exported nearly 8 percent of its fresh-market vegetable and melon supplies (production plus imports)—largely unchanged over the past decade.

Processing Output Up in 2004; Expected To Decline in 2005

Processors of five major vegetables (tomatoes, sweet corn, snap beans, green peas, and cucumbers for pickles) have contracted 1.22 million acres in 2005—down less than 1 percent from the comparable producing States of a year earlier. Contract production accounted for 97 percent of the output of the five leading processing vegetables last year. Canners, which account for two-thirds of all processing vegetable area, have contracted for 1-percent fewer acres than a year ago. Area for tomatoes, the largest single processing vegetable, will be 8 percent smaller than a year ago due to higher carryover stocks and lackluster wholesale prices. Given average yields, total production of the five leading canning vegetables is expected to decline from the 15.0 million short tons of 2004. For processors of frozen vegetables, contract area is forecast to decline 2 percent from year-earlier levels as lower sweet corn and green pea plantings outweigh an 8-percent gain in acreage for snap beans. Given average yields, contract production for the three leading vegetables for freezing is expected to decline 1 to 3 percent from the 2.1 million short tons produced in 2004.

Assuming average acreage losses and yields hovering near the mean of the previous three seasons, total production of the 11 selected processing vegetables could decline 6 to 10 percent from the 17.8 million short tons harvested in 2004. The majority of the decline in processing output this year will likely stem from the expected reduction in California tomato production from last year's near-record levels. Average retail prices for all processed fruits and vegetables increased just over 2 percent during the first 6 months of 2005, reflecting higher packaging, transportation, and marketing costs.

Green peas: The first estimate of 2005 contract production for processing green peas indicated a 3-percent decline from a year earlier to 394,070 short tons. Estimated area for harvest was down 1 percent from a year earlier. Per-acre yields are also expected to drop 3 percent to 1.88 tons after also declining a year earlier (yields were record-high in 2003). Reduced output in Washington (down 23 percent) and Oregon (down 35 percent) is expected to outweigh a 12-percent gain in Minnesota (the top producing State) and a 33-percent jump in Wisconsin. Whole-

sale prices for canned peas over the first 6 months of 2005 are averaging about 2 percent below a year ago, while prices for frozen green peas have been running about 2 percent above the same time a year earlier.

Tomatoes: The 8-percent decline expected in the 2005 contract processing tomato crop follows a 25-percent jump in the total 2004 crop. In 2004, harvested acreage was up 2 percent and favorable weather pushed yields up to a record-high 40.8 short tons per acre. Calendar 2004 import volume for all tomato products (fresh-weight basis) was up 11 percent, with increases in sauces (up 8 percent) and ketchup (up 32 percent) outweighing declines in paste, whole, and juice. Sauces (60 percent) and ketchup (30 percent) accounted for the majority of tomato product imports last year. Imports accounted for 6 percent of domestic consumption in 2004—up slightly from 2003 but down from 8 percent in 2002. With the weaker U.S. dollar and lower domestic wholesale prices, calendar year exports rose 2 percent to a record 3.0 billion pounds (fresh-weight equivalent). This was equivalent to 7 percent of available supply (production plus imports and beginning stocks). Calendar year 2004 per capita use of processing tomatoes increased 1 percent to an estimated 70.4 pounds (fresh-weight)—continuing the recovery from the recession-impacted low of 2001.

Sweet corn: Contract area is expected to rise 1 percent in 2005, with canning area up 4 percent and freezing area down 2 percent. Assuming yields come in near the average of the previous 3 years, processing sweet corn production could increase 1 to 3 percent in 2005. In 2004, processing sweet corn production declined 9 percent to 2.97 million short tons as output of both canning corn (down 6 percent) and sweet corn for frozen products (down 12 percent) declined. The long-run trend in U.S. domestic disappearance of canned sweet corn continues to be negative with 2004 per capita use of canning sweet corn down 2 percent from a year earlier to 8.2 pounds. Over the first 5 years of the 2000s, per capita disappearance averaged 18 percent below average use in the 1990s and 25 percent less than the average of the 1980s. Disappearance of sweet corn for freezing rose 1 percent to 9.1 pounds per person in 2004. During the 2000s, domestic use of sweet corn for freezing declined 5 percent from the average of the 1990s, but remains 24 percent above average use during the 1980s.

Imports of canned sweet corn increased for the eighth consecutive year—rising 37 percent, with Canada supplying 57 percent and Thailand 34 percent. Imports reached a record-high in 2004 and presently account for about 8 percent of consumption compared with 2 percent on average during the 1990s. Exports, the primary market for 18 percent of canned sweet corn supply, increased 6 percent after declining for six consecutive years. However, volume shipped to Japan continued to decline. After peaking in 1998, the volume of canned sweet corn exports to Japan, which still accounts for 36 percent of U.S. canned corn exports, has declined annually. According to data from *The World Trade Atlas*, the volume of Japanese canned sweet corn imports has declined 18 percent since 1995 and the U.S. share has followed that decline. In the meantime, share of market has been gained by Thailand (also has the lowest unit prices), China, and Canada. The estimated U.S. share of the Japanese canned sweet corn import market has dropped from 92 percent in 1995 to 79 percent in 2004.

Fresh Output Down in 2004; Summer 2005 Area Up Slightly

This summer (largely July-September), fresh-market vegetable (excluding melons) area for harvest is forecast to rise less than 1 percent from a year earlier to 305,400 acres. For the most part, increased area for broccoli, tomatoes, and sweet corn will outweigh reductions for crops such as head lettuce, cauliflower, and cabbage. This small gain in summer area follows a decline in spring vegetable area. Although vegetable area is up slightly this summer, melon area for harvest is expected to drop 2 percent, with increased honeydew area (up 7 percent) being outweighed by lower area for watermelon (down 3 percent) and cantaloup (down 5 percent). Although total watermelon area is down this summer, the seedless watermelon category continues to dominate shipments, with seedless now accounting for nearly three-fourths of the movement of all domestically-grown watermelon.

Growers in California, accounting for 46 percent of this year's summer-season vegetable and melon area (down from 47 percent a year earlier), reduced acreage 2 percent. New York, the second leading summer-season producer, with 17 percent of acreage, expects to harvest 7 percent more area than a year ago, due largely to a 14-percent increase in sweet corn acreage. With U.S. fresh-market area little changed from last summer, average yields would leave supplies near the relatively strong volume of July-September 2004. Assuming continued strong economic activity and attendant demand, summer-season fresh-market vegetable prices are also likely to average near the relatively strong levels of the past year. During the summer quarter of 2004 (July-September), prices received by growers and shippers of fresh-market vegetables and melons averaged just 2 percent below the record highs experienced during the summer of 2003.

Despite some severe weather during the late summer and early fall of 2004, annual fresh-market output (including melons) increased 3 percent, and shipping-point prices averaged just 1 percent below those of the previous year. Some of the 2004 fresh-market highlights for selected crops follow:

Head lettuce: With a 4 percent increase in harvested area outweighing slightly lower yields, head lettuce production increased 3 percent in 2004 to 7 billion pounds—the strongest output since 1999. Import volume, which until 2002 was normally less than 1 percent of consumption, fell 2 percent to 92 million pounds—1 percent of domestic disappearance. Export volume rose 5 percent to 475 million pounds, the fourth consecutive annual increase and the highest since 1992. About 7 percent of available supplies were exported in 2004—the most since 1993. The average shipping-point price fell 7 percent to \$16.80 per cwt, with prices strongest in October and February and weakest during March and July. Total disappearance was an estimated 6.6 billion pounds in 2004—up from 6.5 billion pounds the previous year but below the record high of 7.1 billion pounds set in 1989. This was the equivalent of 22.5 pounds per capita, up 1 percent from a year earlier. Head lettuce consumption has been trending lower since peaking in 1989 as consumers have broadened their diets to include other types of lettuces (such as romaine) and leafy greens (such as spinach).

Tomatoes: In 2004, fresh-market field-grown tomato production rose 2 percent to 3.61 billion pounds as area harvested increased 4 percent, outweighing a 2-percent reduction in national per-acre yields. ERS estimates that domestically-produced greenhouse tomatoes added another 375 million pounds to fresh-market tomato

supplies in 2004. Import volume (field and hothouse) declined 1 percent from a year earlier to 2.1 billion pounds, second only to the 2003 record-high volume. Import share of disappearance (including field-grown and domestic greenhouse) fell slightly to 36 percent in 2004. After three consecutive annual declines, U.S. tomato export volume increased 17 percent to 368 million pounds—equal to 6 percent of available supplies. With increased exports offsetting the gain in total supply, the volume used for domestic consumption remained unchanged from a year earlier at 5.66 billion pounds (includes field-grown and greenhouse production). However, with population growing at about 1 percent annually, per capita use declined 1 percent to 19.3 pounds—1 pound less than the 2003 record high. Notably, domestically-produced cherry and grape tomatoes are not included in these estimates since there are no official production estimates, however, imported product is included in the tomato disappearance estimates.

Onions: U.S. fresh-market onion production jumped 16 percent in 2004 to a record-high 7.39 billion pounds largely as a result of the second consecutive record-high yield. National onion yields (for fresh and processing) hit a record 490 cwt per acre in 2004, up 11 percent from the previous record in 2003. Imports, which increased 7 percent to a record-high 703 million pounds, accounted for 11 percent of domestic consumption—down from 12 percent the previous year due to the surge in domestic output. The majority of the imported volume was shipped from Mexico (58 percent of the total), Canada (19 percent), and Peru (16 percent). After a sizeable gain in 2003, onion exports declined 8 percent to 628 million pounds in 2004. With record-high production, strong beginning stocks, and larger imports, domestic per capita use of fresh-market onions jumped 11 percent to 21.7 pounds—a record high.

Spinach: U.S. fresh-market spinach production rose 16 percent in 2004 to 676 million pounds as output in California, the leading producer, increased 14 percent. National output was boosted by a 9-percent gain in harvested area and a 5-percent increase in yield to a record-high 159 cwt per acre. Despite increased domestic output, imports rose 6 percent from the previous year's record level. As with most leafy greens, spinach imports (which largely arrive from Mexico) are relatively minor, accounting for less than 4 percent of domestic disappearance. The United States is currently a net exporter of fresh spinach, with most volume moving into Canada. In 2004, exports accounted for 8 percent of fresh-market spinach supply and totaled 56 million pounds, down 10 percent from 2003. Spinach disappearance rose 18 percent to 610 billion pounds. On a per capita basis, spinach use peaked in 1939 at 2.9 pounds, while 2004 use increased to 2.1 pounds and is projected to increase again in 2005.

Pulse Crops Up in 2005, Potato Acres Record Low

Potatoes: U.S. potato growers planted an estimated 1.11 million acres in all four seasons—the lowest since records began in 1866. Fall-season potato growers expect to harvest 955,700 acres, down 7-percent from a year earlier and the lowest since 1957. Harvested area is expected to be lower for most major fall-producing States, including Idaho (down 7 percent), Washington (down 3 percent), North Dakota (down 15 percent), and Colorado (down 10 percent). During the March to May period, when most fall-season potatoes were being planted, U.S. shipping-point prices for all potatoes averaged \$6.37 per cwt, less than 1-percent below a year earlier but 8-percent below 2 years ago. Because of a continued stretch of low

potato prices and industry efforts to limit acreage due to lackluster potato demand, summer-season potato growers expect to harvest 9-percent fewer acres in 2005. This follows an 11-percent reduction in potato area during the spring season. With per-acre yields expected to be 3-percent lower this summer, the summer potato crop is expected to decline 12 percent. The summer season typically accounts for about 4 percent of the annual U.S. potato crop, with Texas, California, and Missouri the leading States.

In 2004, U.S. potato production declined less than 1 percent from 2003. This was the third consecutive year that total U.S. potato production was little changed. Smaller harvested area (down 6 percent) was offset by record-high yield (up 7 percent to 391 cwt per acre), which left total U.S. potato production down slightly to 456 million cwt. U.S. fall potato production of 410 million cwt in 2004 closely matched the 2003 crop despite a 6-percent reduction in area harvested. Reduced area was largely offset by a 7-percent jump in average yield from 367 to 391 cwt per acre, with higher yields experienced for the spring, summer, and fall crops.

These productivity gains were not enough to prevent potato output from declining during the spring and fall, given fewer acres harvested. Prices were not significantly different from 2003, with demand remaining weak. The 3-percent production gain in Western States, largely from Idaho's crop, almost offset the 8-percent production drop in the Central States. Higher yields in most Western and Central States nearly outweighed reduced harvested areas in most producer States. The 9-million-cwt production gain in Idaho prevented a more significant decline in the rest of the country. In the East, Maine's 13-percent larger crop offset lower output in New York and other Eastern States.

Domestic shipments of potatoes, including chipper and seed potatoes, were about 2-percent lower during January to December 2004 than in calendar year 2003, reflecting partial success by growers in cutting market supply. Also, shipments in the fourth quarter of 2004 were 6 percent below corresponding shipments in 2003. These further indicated subdued demand for domestic potatoes, which was also evident in dampened prices for fresh and processing potatoes. With the exception of August, 2004 monthly prices received by U.S. growers for fresh potatoes were all lower than in 2003. Prices for processing potatoes, however, were about the same as in 2003. One reason for the relatively stronger demand for processing potatoes was greater export volume in 2004 compared with fresh potato exports. Nevertheless, retail prices for frozen french fried potatoes and for potato chips were generally lower in 2004 than in 2003. The preliminary season-average farm price received for all U.S. 2004-crop potatoes was estimated at \$5.62 per cwt, down 5 percent from the previous season.

Sweet potatoes: U.S. sweet potato growers planted 92,300 acres in 2005, down 5 percent from last year and 4 percent below 2003. Three States expect to increase acreage (California, Louisiana, and Mississippi) while the majority of the reduction will come from the top producing State, North Carolina. Growers in North Carolina planted 16 percent less area in response to low prices and higher-than-anticipated carryover from the 2004 season. The season-average price for 2004-crop sweet potatoes was \$17.50/cwt, down 9 percent from the record high set in 2003. The 2004 sweet potato crop was the largest since 1962.

Domestic sweet potato disappearance has been stronger over the past few years. After averaging 5.1 pounds per person during the 1970s, average per capita use fell

during the 1980s and 1990s to 4.6 and 4.1 pounds respectively, reaching an annual low of 3.7 pounds twice in the 1990s. Thus far in the 2000s, per capita use has rebounded to an average of 4.3 pounds, reaching 4.7 pounds in 2004—the highest since 1985. During this time, U.S. exports of sweet potatoes have also surged, rising 64 percent from 2000 to 2004. Exports have risen steadily since the late 1980s—2004 sweet potato exports were more than four times what they were in 1989—indicating that international demand for U.S. sweet potatoes has also increased. About 4 percent of supply is now being shipped to nations such as Canada and the United Kingdom compared with 2 percent of supplies exported in the 1990s.

Dry beans: In 2005, U.S. dry bean growers expect to harvest 1.57 million acres—29 percent more than a year earlier. Planted area increased 24 percent in response to strong dry bean prices, low carryover stocks, and less attractive prices and revenue streams for alternative crops. With only a few exceptions, production is expected to increase for most classes, and prices are expected to weaken into the fall. However, prices for most bean classes are not expected to collapse because the increase in 2005 production is likely to be just sufficient to fill pipelines and satisfy average use over the coming season, with carryover stocks again expected to be relatively low coming into the 2006/07 season.

In 2004, a 9-percent reduction in harvested area (to 1.22 million acres) and 13-percent lower yields sent dry bean production down 21 percent to 17.8 million cwt. Among the major States, the largest reduction in output from a year earlier occurred in North Dakota and Minnesota (each down 39 percent), where yields were cut by an August frost. Output was also reduced in Texas (down 73 percent), Nebraska (down 25 percent) and California (down 16 percent) but production was higher in Michigan (up 27 percent) and Idaho (up 9 percent). Output was reduced for 10 of the 15 identified classes, with the largest percentage declines occurring in Great Northern beans (down 57 percent) and blackeye beans (down 50 percent). In addition to Great Northern and blackeye beans, notable declines were experienced for light red kidney (down 26 percent), pinto (down 25 percent), dark red kidney (down 19 percent), and navy beans (down 15 percent).

Although total dry bean output was down in 2004, higher prices pushed the estimated farm value of the 2004 dry bean crop up 5 percent from a year earlier to \$445 million. Given a second consecutive short crop, carryover supplies dwindled enough to provide strength to prices during the season, with the season average price for all dry beans estimated to have risen 35 percent to \$24.80/cwt. Calendar year dry bean export volume declined for the fifth consecutive year in 2004, falling 17 percent to 567 million pounds—18 percent of available supply. Although imports were up 9 percent, they remained too small a share of the market to overcome the small crop of 2004. As a result, per capita disappearance declined 14 percent from a year earlier to 5.7 pounds—the lowest since 1987.

Dry peas and lentils: Production of dry peas and lentils surged to a record high in 2004. Production of dry edible peas (green and yellow) jumped 120 percent to 11.4 million cwt, exceeding 1943's record 10.0 million. This increase was driven by a 55-percent increase in area harvested and 42 percent higher yields. Yields, which were strong in both the Pacific Northwest and the Upper Midwest, rose 32 percent in North Dakota where the growing season was ideal for dry peas. Production of lentils rose 71 percent to 4.2 million cwt in 2004 due to a combination of a 39-percent rise in U.S. lentil acreage and a 23-percent gain in yields. While increased

area for dry peas was largely driven by the income security provided by the marketing loan program, gains in lentil area were driven largely by market prices, which were strong (above both loan rates and the average of the previous 5 years) in both the 2003 and 2004 crop years. Because of unusually favorable growing conditions and strong yields in the upper Midwest, North Dakota leaped to the forefront of national lentil production with a 104-percent increase in output. The previous market leader, Washington, experienced a 23-percent increase in production.

According to USDA estimates, 2005 dry pea (largely green and yellow) planted area jumped 52 percent to 804,000 acres, while lentil acreage rose 30 percent to 450,000 acres. With relatively favorable weather pointing toward average yields or better, production will again be up substantially for both dry peas and lentils. The new larger crops will add to substantial existing carryover stocks (stored in all positions as of June 1) of 3.2 million cwt for dry edible peas, 1.3 million cwt for lentils, 175,000 cwt of Austrian winter peas, and 26,000 cwt of small chickpeas.

The preliminary 2004/05 season-average price for all dry edible peas fell 22 percent to \$5.98 per cwt, while the average price for all lentils was estimated to have dropped 10 percent to \$15.40 per cwt. However, driven by increased volume, the value of U.S. dry pea production (excluding wrinkled seed peas but including Austrian winter peas) totaled a record \$71 million in the 2004 season—up 72 percent from a year earlier. The 2004/05 lentil crop was valued at a record \$64 million, up 55 percent from a year ago.

Mushrooms: The farm value of all mushroom production during the 2003/04 crop year (July-June), totaled \$920 million, up 3 percent from the previous year. During 2003/04, total U.S. mushroom sales volume increased 1 percent to 857 million pounds. The volume of fresh-market agaricus mushrooms rose 1 percent to 701 million pounds and again accounted for 83 percent of all agaricus sales. Agaricus processing volume rose 3 percent—the first increase since the 1998/99 season. This likely represents a brief pause in the long run industry movement toward the fresh market. Intended agaricus bed and tray production area for the 2004/05 season is largely unchanged from a year earlier at 147 million square feet. While Eastern growers intend to increase area 1 percent, those in the Western States (down 2 percent) and Central States (down 1 percent) expect to reduce square footage. Assuming yields recover from the weather-reduced 2 percent drop in 2003/04 and return to those of the previous 2 years (5.9 pounds/square foot), U.S. agaricus production in the 2004/05 season could reach a record-high 866 million pounds.

The sales volume of specialty mushrooms (excluding brown agaricus), most of which are sold in the fresh market, rose 6 percent to 13.66 million pounds. Gains were experienced across all three categories. Shiitake mushrooms, accounted for 57 percent of specialty volume. The volume of brown agaricus mushroom sales (including Portabello and Crimini varieties) declined 13 percent to 95.8 million pounds in 2003/04—the first decline since the category was initially reported in 1995/96. Popular in both retail and foodservice venues, these varieties account for 11 percent of total agaricus volume and 14 percent of agaricus sales value. Although lower this year, brown agaricus volume is still twice that of 1997/98, when sales totaled 47 million pounds. Per capita use of all mushrooms increased 1 percent in 2003/04 to 4.15 pounds, with the majority of the gain coming from processing mushrooms.

Glossary of Specialized Terms

Arrivals: Quantity of produce received by wholesalers and chain stores in selected cities, as shipped from major production areas.

Carryover stocks: The quantity of product remaining in storage at the end of the crop year.

Cash receipts: The value of commodity marketings during the calendar year, irrespective of the year of production. For program crops, also includes net CCC loans (there are none for vegetables or potatoes).

C.I.F. value: (Cost, insurance, and freight). Terms of sale whereby the seller's (exporter) price includes the cost of the goods being sold and all transportation charges, including insurance expenses, to the destination point (importer).

Cold storage: The quantity of product in refrigerated warehouses at a given point in time.

Constant 2000 dollars: Expression of value in terms of purchasing power in the year 2000. Frequently referred to as deflated or real dollars.

Contract acreage: Area planted by agreement between processors and growers, generally at an agreed price and conditions, including quality.

Customs Import Value: Represents a value in the foreign country and therefore excludes U.S. import duties, freight, insurance, and other charges incurred in bringing the merchandise to the United States. This valuation is primarily used for collection of import duties and frequently does not reflect the actual transaction values (see C.I.F. value).

Cwt: Abbreviation for hundredweight, a unit of measure equal to 100 pounds.

Dual-purpose vegetables: Commodities that may be sold in fresh or processing markets. Dual commodities include asparagus, broccoli, cauliflower, celery, chile peppers, and bell peppers.

Dumping: The sale of a commodity in a foreign market at less than fair market value.

Fall season: Production period which mainly spans October to December.

Farm weight: The raw or unprocessed weight of a product in fresh form prior to any processing; also called fresh-weight, field-run, or orchard-run.

F.A.S. value: (free alongside ship). A price quotation that includes all costs of transportation and delivery of the goods to the dock alongside the ship (or other means of transport).

F.o.b. (free on board) shipping-point price: A price quotation that includes a loading charge at the shipping point but no further transport cost. In this publication, f.o.b. is the average, unweighted unit price received by the shipper or grower-shipper primarily for sales in carload or truckload quantities, but also including mixed loads.

Fresh-cut vegetables (fresh-processed): Fresh-market vegetables that have been trimmed, peeled, or cut (but not heated) into a completely usable fresh product, which is marketed in a prepackaged form. Examples include bagged salads, baby peeled carrots, and broccoli florets. In terms of the data in this report, these products are still considered fresh-market commodities.

Fresh-market vegetables: Sold primarily as fresh; includes artichokes, asparagus, green lima beans, snap beans, broccoli, brussels sprouts, cabbage, cantaloupes, carrots, cauliflower, celery, sweet corn, cucumbers, eggplant, escarole and endive, garlic, radishes, honeydews, lettuce, onions, bell peppers, spinach, tomatoes, and watermelons. Includes fresh-cut products such as baby carrots, baby spinach, and bagged salads.

Grower-packer return: Price received by the grower-packer.

Marketing spread: The difference between the retail price and the grower-packer return.

Pack: The quantity of fresh or processed product placed in containers (e.g., cans). Generally refers to the output of a processing industry (e.g., frozen pack of broccoli).

Pay weight: The weight of useable product delivered to the processing plant and paid for at the rates specified by contract.

Per capita use: A measure of commodity disappearance on a per-person basis. Equal to total supply (production plus imports plus beginning stocks) less uses (exports, shrink and loss, seed use, ending stocks) divided by total U.S. population (including military).

Processing vegetables: Commodities sold primarily to processors; include (but not limited to) green lima beans, snap beans, beets, cabbage, sweet corn, cucumbers, chile peppers, green peas, spinach, and tomatoes.

Product weight: The weight of a product in its final packaged form. For example, the weight of the contents of a can of tomato paste.

Pulses: A term used collectively for dry edible beans, dry edible peas, Austrian winter peas, and lentils.

Season-average price: Average price received by the grower-packer (grower-shipper), weighted by quantity marketed.

Shipments: Quantity of produce marketed from major production areas.

Short ton: A unit of measure equal to 2,000 pounds. A metric ton is equal to 1,000 kilograms or 2,204.62 pounds.

Specialties: A term for commodities (limited here to vegetables) not generally considered to be mainstream. Examples include jicama, dasheen, and cassava. May also include "minor vegetables," such as okra, chile peppers, pumpkins, and tropical vegetables.

Spring season: Production period which mainly spans April to June.

Summer season: Production period which mainly spans July to September.

Value of production: The value of commodities produced during the crop year. Calculated as production times marketing year average price. May be equal to cash receipts when the crop year for a vegetable runs from January through December.

Winter season: Production period which mainly spans January to March.

Selected Conversion Factors

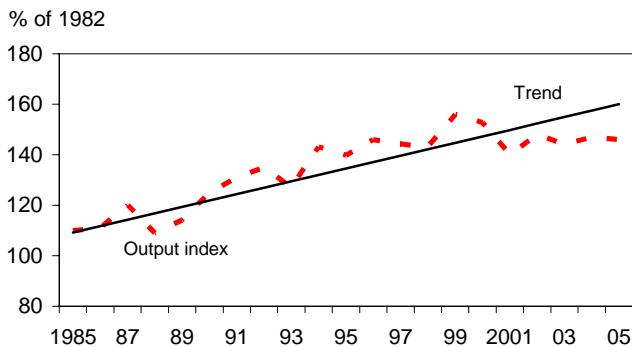

1 hundredweight (cwt) = 100 pounds
1 cwt = 0.04536 metric tons
1 ton = 2000 pounds
1 short ton = 1 ton (2000 pounds)
1 kilogram = 2.204622 pounds
1 metric ton = 1,000 kilograms
1 metric ton = 1.102311 short tons
1 metric ton = 2204.622 pounds
1 hectoliter = 26.41721 gallons
1 short ton per acre = 0.4467 times 1 metric ton per hectare
1 cwt per acre = 1 hectogram per hectare divided by 1120.953
1 hectare = 2.471 acres
1 acre = 43,560 square feet
1 square mile = 640 acres

Cents per pound = Dollars per cwt divided by 100.

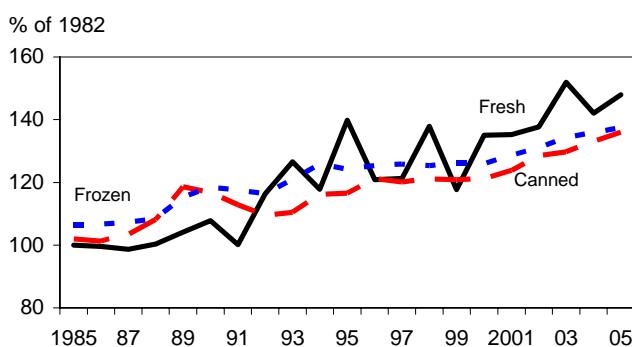

1 pound dried garlic = 2.7 pounds fresh
1 pound dried chile peppers = 8 pounds fresh
1 pound frozen spinach = 1.43 pounds fresh
1 pound frozen french fried potatoes = 2 pounds fresh potatoes
1 pound potato chips = 3.5 pounds fresh potatoes

79. Broccoli: U.S. monthly average retail price, marketing spread, and shipping-point price, 1995-2005.....	93
80. Lettuce, iceberg: U.S. monthly average retail price, marketing spread, and shipping-point price, 1979-2005.....	94
81. Tomatoes, fresh field-grown: U.S. monthly average retail price, marketing spread, and shipping-point price, 1979-2005.....	95
82. Potatoes, fresh: U.S. retail price, marketing spread, and grower-packer return, 1979-2005.....	96

Processing Vegetables

83. Vegetables, selected: Fresh and processing per capita utilization, 1979-2005.....	97
84. Vegetables, processing: Harvested acreage for canning and freezing, 1979-2004.....	98
85. Vegetables, processing: Production for canning and freezing, 1979-2004.....	99
86. Vegetables, processing: Value of production for canning and freezing, 1979-2004.....	100
87. Vegetables, processing: Raw product prices for canning and freezing, 1979-2004.....	101
88. Vegetables, processed: U.S. monthly and annual retail price index, 1986-2005.....	102
89. Vegetables, processing: Selected U.S. per capita utilization, 1979-2005.....	103
90. Vegetables and fruits, dehydrated: U.S. monthly and annual producer price index, 1982-2005.....	104
91. Vegetables, canned: U.S. monthly and annual producer price index, 1979-2005.....	105
92. Vegetables, canned: Selected U.S. imports, by type, 1979-2004.....	106
93. Vegetables, canned: Selected U.S. exports, by type, 1979-2004.....	107
94. Selected canned vegetables: U.S. export value to selected countries and the world, 1998-2004.....	108
95. Selected canned vegetables: U.S. import value from selected countries and the world, 1999-2004.....	109
96. Vegetables, frozen: Pack and carryover, 1979-2004.....	110
97. Vegetables, frozen: Annual pack of major vegetables, 1979-2004....	111
98. Vegetables, frozen: January 1 stocks of major vegetables, 1979-2005.....	112
99. Vegetables, frozen: U.S. monthly and annual producer price index, 1979-2005.....	113
100. Vegetables, frozen: U.S. imports, by type, 1979-2004.....	114

101. Vegetables, frozen: U.S. exports, by type, 1979-2004.....	115
102. Selected frozen vegetables: U.S. import value from selected countries and the world, 2000-2004.....	116
103. Selected frozen vegetables: U.S. export value to selected countries and the world, 1997-2004.....	117

Potatoes and Sweet Potatoes

104. Potatoes: Harvested acreage, by season, 1979-2005.....	118
105. Potatoes: Production, by season, 1979-2005.....	119
106. Potatoes, all seasons: Production, by major State, 1979-2004.....	120
107. Potatoes, all seasons: Crop-year utilization, 1979-2004.....	121
108. Potatoes: Season-average price and value of farm sales by season, 1979-2003.....	122
109. Potatoes, all: U.S. monthly and season-average grower price, 1985-2005.....	123
110. Potatoes, fresh market: U.S. monthly and annual retail price index, 1979-2005.....	124
111. Potatoes, frozen french fries: U.S. monthly and annual producer price index, 1979-2005.....	125
112. Potatoes: U.S. monthly retail price, by product, 1984-2005.....	126
113. Potatoes: Selected U.S. imports, by type, 1979-2004.....	127
114. Potatoes: Selected U.S. exports, by type, 1979-2004.....	128
115. Potatoes: U.S. per capita utilization, by category, 1978-2005.....	129
116. Sweet potatoes: Production, by State, 1979-2004.....	130
117. Sweet potatoes: U.S. acreage, yield, production, and value, 1979-2005.....	131

Pulses

118. Dry edible beans: Harvested acreage, by State, 1979-2005.....	132
119. Dry edible beans: Production, by class, 1979-2004.....	133
120. Dry edible beans: Production, by State, 1979-2004.....	134
121. Dry edible beans: Value of production, by State, 1979-2004.....	135
122. Dry edible beans: Season-average wholesale price, by class, 1979-2004.....	136
123. Dry edible beans: U.S. monthly and season-average grower price, 1979/80-2004/05.....	137
124. Dry edible beans: U.S. imports, by class, 1979-2005.....	138
125. Selected dry beans: U.S. export value to selected countries and the world, 2000-2004.....	139
126. Dry edible beans: U.S. exports, by class, 1979-2005.....	140
127. Dry edible beans: U.S. per capita use for selected classes, 1979-2005....	141
128. Dry edible peas: U.S. acreage, yield, production, and value, 1979-2005.....	142
129. Lentils, dry: U.S. acreage, yield, production, and value, 1979-2005....	143
130. Austrian winter peas, dry: U.S. acreage, yield, production, and value, 1979-2005.....	144
131. Dry edible peas and lentils: U.S. producer price index, 1991/92-2004/05.....	145
132. Dry peas and lentils: U.S. exports, by class, 1979-2004.....	146

133. Dry peas and lentils: U.S. imports, by class, 1979-2004.....	147
---	-----

Mushrooms

134. Agaricus mushrooms: Production, by type of sale, 1979/80 2003/04....	148
135. Agaricus mushrooms: Price and value, by type of sale, 1979/80-2003/04.....	149
136. Mushrooms: U.S. monthly and annual imports, 1989-2005	150
137. Mushrooms, fresh-market and canned: U.S. monthly and annual exports, 1989-2005.....	151
138. Mushrooms, all: U.S. per capita utilization, 1979-2005.....	152
139. Specialty mushrooms: Production, price and value, by type of sale, 1986/87-2003/04.....	153

Specialties and World Production

140. Specialty vegetables: Fresh and processed imports, 1980-2004.....	154
141. Specialty and minor vegetables, fresh and processed: Harvested acreage, California, 1989-2003.....	155
142. Specialty and minor vegetables, fresh and processed: Production, California, 1989-2003.....	156
143. Specialty and minor vegetables, fresh and processed: Value of production, California, 1989-2003.....	157
144. Specialty vegetables, fresh market: U.S. domestic and imported shipments, 1989-2004.....	158
145. Selected vegetable production in leading countries and the world, 1996-2004.....	159
146. Selected vegetable harvested acreage in leading countries and the world, 1996-2004.....	162

f = Forecast. r = Revised. -- = Not available. 1/ All production for processing broccoli and cauliflower is for freezing. 2/ On-cob basis. 3/ In-shell basis.

4/ Includes domestically-produced greenhouse tomatoes after 1996 (all years include imported greenhouse tomatoes). 5/ Includes artichokes, brussels sprouts eggplant, endive/escarole, garlic, radishes, green limas, squash, & spinach. In 2000, okra, pumpkins, kale, collards, turnip greens, and mustard greens added

6/ Includes beets, green limas (1992-2004), spinach, and miscellaneous imports (1990-2004). 7/ Includes green limas, spinach, and miscellaneous freezing vegetables. 8/ Fresh, canning, and freezing data do not sum to the total because onions for dehydrating are included in the total. 9/ Production from new areas in the upper Midwest added in 1998. A portion of this is used for animal feed.

p = Preliminary. 1/ Excludes melons, potatoes, and mushrooms. 2/ Monthly distribution as reported by the Census is partly in error for 1976, 1980, 1981, and 1986.

For July and August of 1981 and May of 1986, some quantities are included that actually arrived in earlier months. 3/ Import data beginning January 1989 are reported under the Harmonized Tariff Schedule (HS) of the U.S. Department of Commerce

Source: Bureau of the Census, U.S. Department of Commerce.

-- = Not available. f = ERS forecast.

1/ Excludes potatoes, sweet potatoes, and mushrooms. 2/ Includes fresh and processing. 3/ After 1996, includes an ERS estimate of domestically-produced hothouse tomatoes. Hothouse tomato imports continue to be included in all years. 4/ Includes radishes, Brussels sprouts, squash, and green lima beans. Green lima beans included since 1992. Beginning with 2000, also includes collards, kale, mustard greens, turnip greens, okra, and pumpkins.

1/ Monthly distribution as reported by the Census Bureau is partly in error for 1981 and 1986. For July and August of 1981 and May of 1986, some quantities are included that actually arrived in earlier months. 2/ Import data beginning January 1989 are reported under the Harmonized Tariff Schedule (HS) of the U.S. Department of Commerce.

1/ Source: National Agricultural Statistics Service, USDA (1970-81 and 1992-present). Between 1981 and 1991, production is from the California County Agricultural Commissioners' annual report. 2/ Source: Bureau of the Census, U.S. Department of Commerce. From 1978-89, exports were adjusted using Canadian import data from Statistics Canada. Includes dried garlic and garlic flour after 1977. Dried adjusted to fresh basis using the factor 2.7.

3/ Seed use estimated as 2 percent of California output until 2000 when seed-producing states were added to the NASS production estimate.

4/ Constant-dollar prices were calculated using the GDP implicit price deflator, 2000=100.

1/ Excludes onions for fresh, canning, and freezing. 2/ From 1979-92, estimated as 76 percent of California summer crop.

After 1992, production for processing estimated by USDA/NASS. Price data also estimated by USDA/NASS starting in 1993

crop. 3/ Product-weight data was converted to fresh basis using factor of 9.0. 4/ Data from FATUS, USDA-ERS

5/ Stocks are for raw product to be processed and do not include finished inventory. Estimated as 80 percent of California summer onion stocks from 1970-80. Since 1980, estimated as 2.5 percent of U.S. Jan 1 onion inventory.

6/ Estimated as 50 percent of California's summer crop shrinkage and loss (assumes lower shrink in processing)

7/ Unit value of California onions destined for processing. 8/ Deflated by the GDP implicit price deflator, 2000=100

-- = Not available.

1/ Exports are in product weight as reported by Census. Due to under-reporting, U.S. exports to Canada prior to 1990 may be understated.

2/ Excludes shelled beans. 3/ Data were converted from gallons using a factor of 8.485 pounds per gallon. 4/ Tomato products not elsewhere classified. For 1989-2004, represents whole tomatoes.

1/ Crop year begins July 1 and ends June 30. 2/ From 1970 to 1988, includes all dried, desiccated, and dehydrated peas, other than split peas. After 1988, under the Harmonized Tariff Schedule, green, yellow, and split peas were shown separately. 3/ From 1979 to 1988, includes green and yellow peas.

After 1988, includes split peas only. 4/ Includes Austrian winter peas and misc. dry peas. 5/ Planting seed. 6/ Pea data series broken following the 1987/88 season due to the January 1989 change to the harmonized system. Data in this table prior to 1989 are on a Sept-Aug year

p = Preliminary. -- = Not available. Units are million hundredweight (cwt). One million cwt is equal to 100 million pounds or 50,000 US tons.

1/ Includes fresh and processing production. U.S. data may not match data elsewhere in this report due to reporting delays. Some U.S. data was

updated by ERS. 2/ The United States was eleventh largest in 2004. 3/ The U.S. is the eighth largest producer. 4/ The U.S. is the nineteenth largest producer.

5/ Largely string beans. 6/ Includes green peppers and chile peppers. 7/ The U.S. is fifteenth largest.

Source: Derived from data supplied by FAOStat (03/28/05), Food and Agriculture Organization, United Nations.
