

Agriculture and European Union Enlargement. Tim Josling, David Kelch, Peter Liapis, and Stefan Tangermann. Market and Trade Economics Division, Economic Research Service, U.S. Department of Agriculture. Technical Bulletin No. 1865.

Abstract

Potential accession of a number of eastern and central European countries into the European Union (EU) seems destined to lead to further reforms of the Common Agricultural Policy (CAP). The financial costs of absorbing these countries may be extreme. This report documents the modeling framework (European Simulation Model, ESIM) used to analyze the 1992 CAP reform and discusses possible effects of EU enlargement.

Keywords: CAP Reform, European Union, EU, European Union Enlargement

Acknowledgment

The authors are particularly indebted to the previous work completed by Ralph Seeley at ERS on the U.S./EC model that became the basis for the European Simulation Model (ESIM). Seeley also contributed significantly to the current structure and format of ESIM which enabled the authors to run numerous variations of ESIM with relative ease. Mildred Haley played an integral role in the structure of the model and introducing a vast amount of critical parameters in the feed/livestock sector of ESIM. Haley worked closely with Professor Jan Blom of Agricultural Economics Research Institute (LEI-DLO), the Dutch equivalent of ERS, to develop the extensive feed matrices for ESIM, and provided intellectual rigor to model development. Professor Blom's experience with modeling the EU's feed livestock sector proved invaluable to the development of the parameters that comprised the feed demand matrices. Martin Johnson, currently with the Australian Industries Commission and formerly with ERS, created the indispensable area allocation portion of ESIM that allowed the authors to determine the effects of CAP reform on supply of grains and oilseeds in the EU-12. Finally, we would like to thank Robert Koopman, former Chief of the Europe, Africa, and Middle East Branch, for his support of the project.
